CF-5A's Intervention goals are:

- To start the patient-provider smoking cessation conversation with the patient through a self-administered PhreesiaPad Intervention assessment in the clinic waiting area, available in English and Spanish.
- To cultivate a collaborative exchange between patient and provider while addressing patient smoking cessation needs and clinic system obstacles of time, counseling expertise, data entry, follow-up and cost.

CF-5A's Philosophy is based on:

- Patient centered care that enables engagement, inclusion, non-judgment and efficacy with clinic's providers and staff.
- Meeting the current need to support overstretched providers by saving time through the PhreesiaPad while improving quality of care delivery.
- Intervention's flow to minimize practice burden and create added value to patient.
